1<sup>st</sup> April 2020

Dear Stephen

**RE: NH<sub>3</sub> Monitoring Report 01 – 31 March 2020**

**Background**

Gore District Council (GDC) engaged Land and Water Science to conduct continuous monitoring of ammonia (NH<sub>3</sub>) gas emissions from the Mataura Mill dross storage site (121 Kana Street, Mataura) from April 2018. GDC require emission values to comply with consent conditions that specify a limit of 5 ppm NH<sub>3</sub> discharged to air. In March 2017, Photonic Innovations (PI) installed two NH<sub>3</sub> sensors for comparison of the indoor and outdoor ammonia levels. Measurements are recorded continuously and reported as a 5-minute average for both the outdoor and indoor sensors.

**March Summary**

Weekly summaries of the indoor and outdoor emission results from monitoring between 01 March and 31 March are presented in this report. During this period the maximum NH<sub>3</sub> concentration detected by the indoor sensor was 12.4 ppm (Figure 1 and Table 1) and 10.2 ppm for the outdoor sensor (Figure 2 and Table 2). Maximum mean and median NH<sub>3</sub> concentrations during this period were 6.7 and 6.5 ppm for the indoor sensor and were 0.8 and 0.7 ppm for the outdoor sensor. The maximum ammonia concentration for both sensors exceeded the consented amount of 5.0 ppm on numerous occasions.

Daily (diurnal) variation in NH<sub>3</sub> concentration shows a consistent pattern in the data. Specifically, NH<sub>3</sub> concentration is strongly correlated with air temperature, reaching maximum values as air temperatures peak during the day and minimum values at night when air temperatures are at their lowest. Although diurnal variation is evident in the data, average air temperature is a greater control over the absolute concentration with maximum concentrations recorded during the warmest months of the year and minimum concentrations recorded during the coolest months of the year. The correlation between air temperature and NH<sub>3</sub> concentration for this reporting period is displayed in Figure 1 and Figure 2.

Table 1. Summary statistics for the indoor NH<sub>3</sub> sensor, 01 March – 31 March 2020. NH<sub>3</sub> measured in parts per million (ppm).

Date	01-07 Mar	08-14 Mar	15-21 Mar	22-28 Mar	29-31 Mar
Mean	6.7	6.5	4.7	4.0	4.8
Std Dev	2.2	1.5	1.2	0.7	1.6
Median	6.5	6.1	4.5	4.0	4.3
Minimum	2.4	3.9	2.7	2.2	2.9
Maximum	12.4	11.3	9.1	7.2	11.0

Table 2. Summary statistics for the outdoor NH<sub>3</sub> sensor, 01 March – 31 March 2020. NH<sub>3</sub> measured in parts per million (ppm).

Date	01-07 Mar	08-14 Mar	15-21 Mar	22-28 Mar	29-31 Mar
Mean	0.7	0.8	0.8	0.8	0.8
Std Dev	0.4	0.6	0.6	0.5	0.6
Median	0.6	0.7	0.6	0.7	0.7
Minimum	0.3	0.4	0.3	0.4	0.4
Maximum	4.9	10.2	6.6	6.3	9.2

#### 01 - 07 Mar 2020

During this week, the indoor NH<sub>3</sub> concentration showed consistent diurnal variation for most of the week. Maximum indoor concentration was 12.4 ppm for this period. Mean and median values were 6.7 and 6.5 ppm respectively. The outdoor NH<sub>3</sub> concentration levels showed consistent variation for most of the week with higher concentrations consistent with warmer temperatures. Maximum outdoor concentration was 4.9 ppm for this period. Outdoor mean and median values were 0.7 and 0.6 ppm respectively.

#### 08 – 14 Mar 2020

During this week, indoor NH<sub>3</sub> concentration showed consistent diurnal variation for most of the week. Maximum indoor concentration was 11.3 ppm for this period. Mean and median values were 6.5 and 6.1 ppm respectively. The outdoor NH<sub>3</sub> concentration levels showed consistent variation for most of the week with higher concentrations consistent with warmer temperatures. Maximum outdoor concentration was 10.2 ppm for this period. Outdoor mean and median values were 0.8 and 0.7 ppm respectively.

#### 15 – 21 Mar 2020

During this week, indoor NH<sub>3</sub> concentration showed consistent diurnal variation for most of the week. Maximum indoor concentration was 9.1 ppm for this period. Mean and median values were 4.7 and 4.5 ppm respectively. The outdoor NH<sub>3</sub> concentration levels showed consistent variation for most of the week with higher concentrations consistent with warmer temperatures. Maximum outdoor concentration was 6.6 ppm for this period. Mean and median values were 0.8 ppm and 0.6 ppm respectively.

#### 22 – 28 Mar 2020

During this week, indoor NH<sub>3</sub> concentration showed consistent diurnal variation for most of the week. Maximum indoor concentration was 7.2 ppm for this period. Mean and median values were 4.0 and 4.0 ppm respectively. The outdoor NH<sub>3</sub> concentration levels showed consistent variation for

most of the week with higher concentrations consistent with warmer temperatures. Maximum outdoor concentration was 6.3 ppm for this period. Mean and median values were 0.8 and 0.7 ppm respectively.

### **29 – 31 Mar 2020**

During this week, indoor NH<sub>3</sub> concentration showed consistent diurnal variation for most of the week. Maximum indoor concentration was 11.0 ppm for this period. Mean and median values were 4.8 and 4.3 ppm respectively. The outdoor NH<sub>3</sub> concentration levels showed consistent variation for most of the week with higher concentrations consistent with warmer temperatures. Maximum outdoor concentration was 9.2 ppm for this period. Mean and median values were 0.8 and 0.7 ppm respectively.

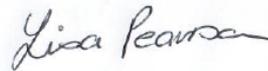

### **Summary**

During the monitoring period (01 – 31 March) indoor NH<sub>3</sub> concentrations reached a maximum of 12.4 ppm, while maximum mean and median concentrations were 6.7 and 6.5 ppm respectively. Outdoor concentrations were a maximum of 10.2 ppm, while maximum mean and median concentrations were 0.8 and 0.7 ppm respectively. The indoor and outdoor sensor exceeded the consent conditions of 5.0 ppm during the month of March. These values are consistent with warmer outdoor temperatures. Overall, temperature continues to be the most dominant control over NH<sub>3</sub> concentration.

Kind regards
